Abstract of JP4156780

PURPOSE: To enable the color printing with an arbitrary color with simple operation by performing the color printing while developed to a corresponding bit map memory based on color information arbitrarily stored in a storage part in advance. **CONSTITUTION:** The color information is set to a storage part 2 in advance for each media, a color development part 3-1 writes the printing data printing-indicated based on the color information set for each media in advance, and the color printing is performed based on the dot data read out from these memories 4. Therefore, it is not necessary to add the color information on this printing data based on the printing data prepared for a monochromatic printer. Thus, the color printing can be easily performed with the arbitrary color designated in advance for each media unit.
